

SmartTrack API Changes - Student / Parent

Base URL: `{{base_url}}`

Changed-APIs-only reference for the parent app -- covers just the endpoints affected by two recent changes: leave no longer has an approval stage, and buses/routes/drivers were decoupled into independent entities. For the full parent API surface, see SmartTrack_API_Documentation_StudentParent.pdf instead; this doc is a focused diff.

Summary of what changed: - Leave requests are pre-approved. Create Leave Request now comes back with status "approved" immediately, for every caller -- there is no pending/review stage left at all. Don't build a "waiting for approval" state around it anymore; an admin can still reject/revoke one afterward. - A child's route may show no bus/driver between runs. bus_number / driver_name on a route are now populated only while a trip is actually in progress on it -- there's no persistent assignment to fall back on.

Contents

- 2. Lookups (capture IDs) (1 requests)
- 6. Leave (1 requests)

Collection Variables

Seeded demo accounts and IDs used throughout this reference. Values left blank are captured automatically at runtime (tokens, ids, QR codes) rather than fixed ahead of time.

Variable	Default / Notes
<code>baseUrl</code>	<code>http://localhost:5000/api</code>
<code>school_admin_token</code>	<i>(captured at runtime)</i>
<code>parent_token</code>	<i>(captured at runtime)</i>
<code>student_id</code>	<i>(captured at runtime)</i>

2. Lookups (capture IDs)

1. List Routes (school_admin)

GET `{{base_url}}/routes`

Request Headers

Header	Value
<code>Authorization</code>	<code>Bearer {{school_admin_token}}</code>

Response Example

200

```
{
  "routes": []
}
```

Auto-Captured Variables (test script)

```
const data = pm.response.json();
if (data.routes && data.routes.length) {
  pm.collectionVariables.set('route_id', data.routes[0].id);
  if (data.routes[0].route_qr_code) pm.collectionVariables.set('route_qr_code', data.routes[0].route_qr_code);
  if (data.routes[0].stops && data.routes[0].stops.length) pm.collectionVariables.set('stop_id', data.routes[0].s
}
```

6. Leave

1. Create Leave Request (parent)

POST `{{base_url}}/leave`

[CHANGED] Leave is granted the moment it's applied for -- the response now comes back with status "approved" immediately (there is no more pending/review stage for anyone, parent or admin). Still fails with 403 unless `{{student_id}}` is this parent's own child (matched by login email).

Request Headers

Header	Value
<code>Authorization</code>	<code>Bearer {{parent_token}}</code>

Request Body

```
{
  "student_id": "{{student_id}}",
  "from_date": "2026-09-01",
  "to_date": "2026-09-02",
  "reason": "Family trip"
}
```

Response Example

201

```
{
  "leave": { ... }
}
```

Auto-Captured Variables (test script)

```
const data = pm.response.json();
if (data.leave) pm.collectionVariables.set('leave_id', data.leave.id);
```
